
At $I_{UV} = 10^3$ the equilibrium curve is MONOTONIC: no dP/d$n = 0$ turning points, hence no thermally unstable range.

The marked $n_{W,\,max}$, $n_{C,\,min}$ (carried over from $I_{UV} = 158$) and P_{min}, P_{max} (from $I_{UV} = 63$) are the interpolators' constant edge fill, not features of this curve.
